Education

Shadan College Of Engineering And Technology — Hyderabad, T.S
Bachelor of Technology in Computer Science And Engineering — *Nov 2022 - May 2026*

Sri Chaitanya Junior College — Hyderabad, T.S
M.P.C — *Jun 2019 - May 2021*

Projects

Zebra Search | *TypeScript, Node.js, SQLite (Edge),React* | *Live* | *GitHub* — Feb 2026 – Apr 2026

- A full-stack search engine for technical content, built from scratch crawler through ranked query results.
- Built a strict-mode web crawler in TypeScript that crawled 50,000+ pages and indexed 10,000+ high-quality documents, enforcing minimum content length and keyword density thresholds to filter low-signal pages
- Designed a multi-factor content scoring system combining freshness, domain authority, and personalization signals targeting curated technical domains including engineering blogs, algorithm resources, and distributed systems content.
- Implemented a query engine backed by an edge SQL database and embedding-based scoring, achieving sub-1-second query response time across the full index.
- Built a Node.js backend exposing search and indexing APIs, with end-to-end pipeline ownership from indexer to ranked result.

Sketch.io | *React, TanStack, Node.js, WebSockets* | *Live* | *GitHub* — Nov 2025 – Jan 2026

- A multiplayer drawing application supporting simultaneous real-time collaboration across multiple users.
- Architected real-time canvas synchronization using WebSockets, enabling two or more users to draw simultaneously with low-latency state propagation
- Built collaborative session and room management so users join isolated drawing sessions with shared canvas state.
- Implemented shape tools, freehand drawing, undo/redo history, and canvas export — building the full feature surface of a production whiteboard tool.
- Built the frontend with React and TanStack Query, managing server state and optimistic UI updates for a smooth real-time experience.

Signal | *TypeScript, Next.js, Inngest, MongoDB* | *Live* | *GitHub* — Sept 2025 – Oct 2025

- Architected a full-stack stock intelligence platform with dashboard, search, and watchlist modules, aggregating real-time market data, sector heatmaps, and news signals across 500+ equities.
- Built an advanced stock analysis interface with candlestick charts, financial metrics, and technical indicators, enabling sub-200ms interaction latency for user-driven queries.
- Implemented dynamic search with server-side fetching and caching, reducing redundant API calls by 40% and improving response times under repeated queries.
- Designed a personalized watchlist system with persistent storage, supporting real-time updates and tracking for 50+ user-selected stocks per session, secured via session-based authentication.

Technical Skills

Languages: TypeScript, Python, Java, HTML/CSS, SQL
Frameworks & Runtime: React, Node.js, Express.js, FastAPI
Databases: MongoDB, Postgres, Redis, MySQL
Tools & Platforms: Git, Docker, Cursor, GitHub
Libraries: Prisma, Zod, Pydantic, Better-auth

Achievements

- Solved 325+ DSA problems on LeetCode and HackerRank.
- Participated in 14+ contests, improving rating by 65%.
