Experience

Full Stack Engineer Sept 2026 – Present

Yuvi Works Pvt Ltd · Hyderabad, India

- Build features end to end on the HRMS platform and the Accounts app, from backend logic through to the UI.
- Own performance work on both products: trace slow pages and backend paths to the root cause and fix them.
- Write backend tests for HRMS and Accounts business logic so core workflows keep working as the code changes.
- Take features from requirements through code review to release, working closely with an early-stage team.

Software Engineering Intern Jan 2026 – June 2026

Stalwart.ae · Dubai, UAE (Remote)

- Shipped production features on a React and Node.js stack, from spec to live deployment in agile sprints.
- Integrated third-party payment and logistics APIs with retry queues and webhook signature validation, which cut failed transaction incidents by about 40%.
- Moved untyped REST route handlers to strict Zod schemas so bad input is rejected at the API boundary.
- Wrote the team's first tests for financial flows in Jest, covering the critical payment paths end to end.

Projects

Zebra Search | *TypeScript, Node.js, SQLite Edge, React, Cloudflare Workers* | GitHub Feb – Apr 2026

- Built a search engine from scratch: strict-mode crawler, tokenized indexer, multi-factor ranking pipeline, query UI.
- Crawled 50,000+ pages through quality gates (minimum content length, keyword density thresholds, duplicate URL fingerprinting) so only useful documents made it into the index.
- Ranked results with a hybrid model: BM25-style lexical scoring plus embedding-based semantic similarity, weighted by freshness decay and domain authority.
- Served queries from Cloudflare D1 (edge SQLite) on a globally distributed deployment, with end-to-end query latency under 1s and no cold-start penalty.

Meridian | *Python, FastAPI, PostgreSQL/pgvector, Redis, TypeScript/Next.js* | GitHub Jun – Aug 2026

- Built a RAG code-review system: code is chunked with tree-sitter, stored as 2048-dim embeddings in pgvector, and the top 20 chunks by cosine similarity ground each LLM review in the real codebase.
- Automated PR reviews from HMAC-verified GitHub webhooks (<2s response), deduplicated in Redis (24h TTL) and run by RQ workers through a 4-stage pipeline: validation, retrieval, generation, and citation mapping.
- Streamed live pipeline progress over SSE backed by Redis Streams, with per-stage latency metrics and event replay, so a client that reconnects mid-review picks up where it left off.
- Made review generation idempotent with a (repo_id, pr_number, head_sha) dedup key and Redis locks; ingest batches embeddings 32 chunks per call and skips unchanged files by checksum.

Technical Skills

Languages: TypeScript, Python, SQL, HTML/CSS
Frameworks & Runtimes: Node.js, Express.js, FastAPI, Bun, React, Next.js
Databases: PostgreSQL, Redis, MongoDB, MySQL, SQLite (Cloudflare D1)
Tools: Docker, Git, Turborepo, Cloudflare Workers, Prisma, Zod, WebSockets, SSE, Jest
AI / ML: LLM integration, embedding retrieval, RAG pipelines, vector scoring

Education

Shadan College of Engineering and Technology Hyderabad, T.S.

Bachelor of Technology in Computer Science & Engineering *Nov 2022 – May 2026*

Achievements

Solved 400+ DSA problems on LeetCode and HackerRank.
Competed in 14+ contests, raising contest rating by 65%.
